

Filtrage interactif de données multi-dimensionnelles

Patrick Brockmann
LSCE (UMR 8212 / CEA-CNRS-UVSQ)

SIST 2016 : Séries Interopérables et Systèmes de Traitement
29-30 sept. 2016 Montpellier (France)

Un partage d'expérience sur la réalisation d'une application d'exploration de données

Contexte

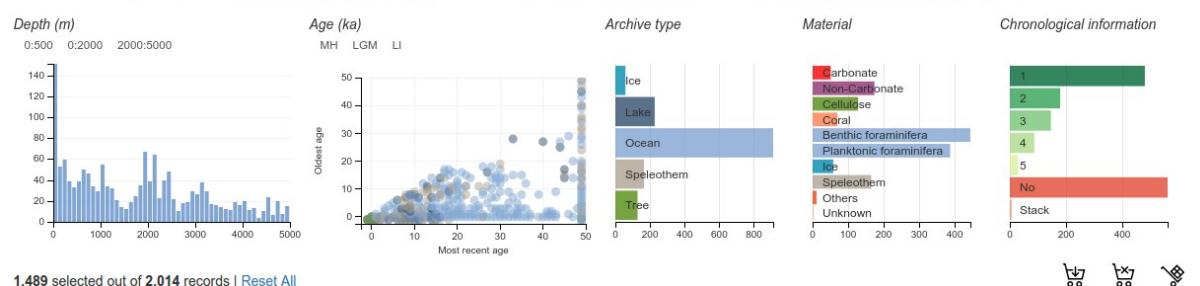

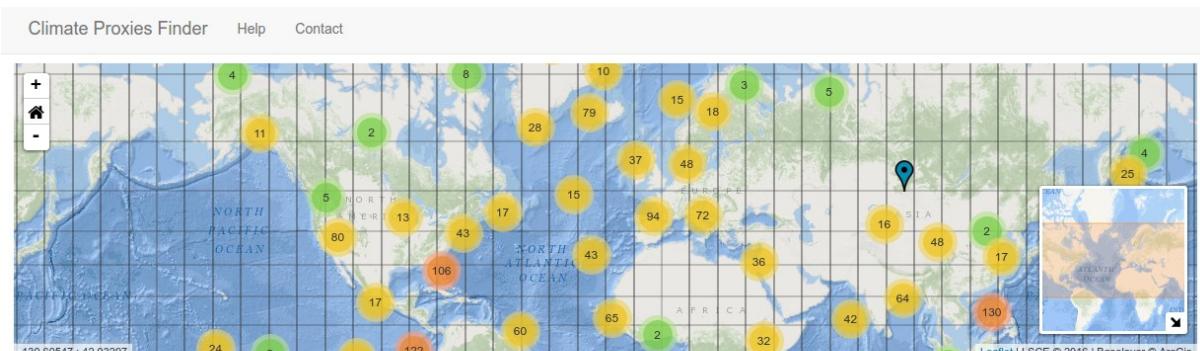

- Données paléoclimatiques
- Renfort sur un projet en cours

Problématiques

- Vérification des traitements
- Analyse exploratoire
- Diffusion des résultats

Ressources

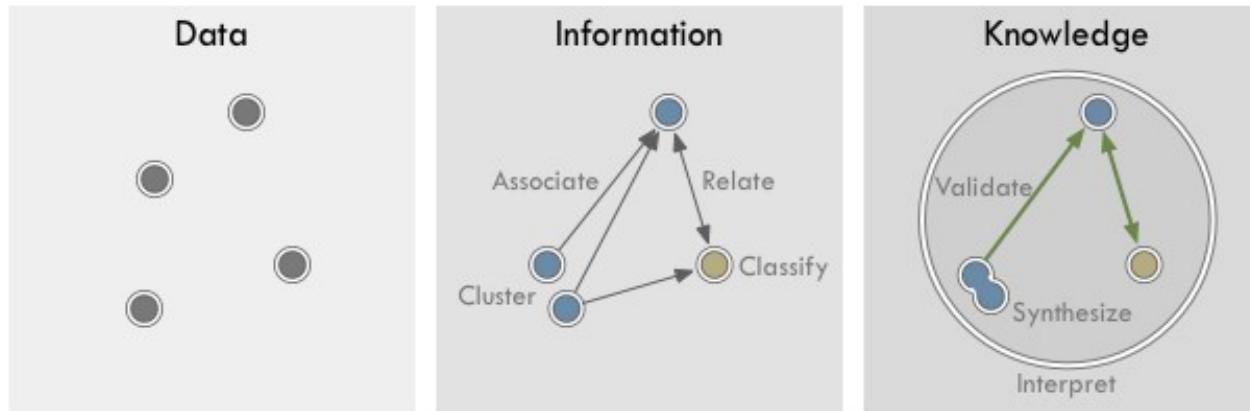

- 1 personne sur quelques semaines

Motivations

Accompagner la Recherche sur la transformation des Données en Informations et en Connaissances.

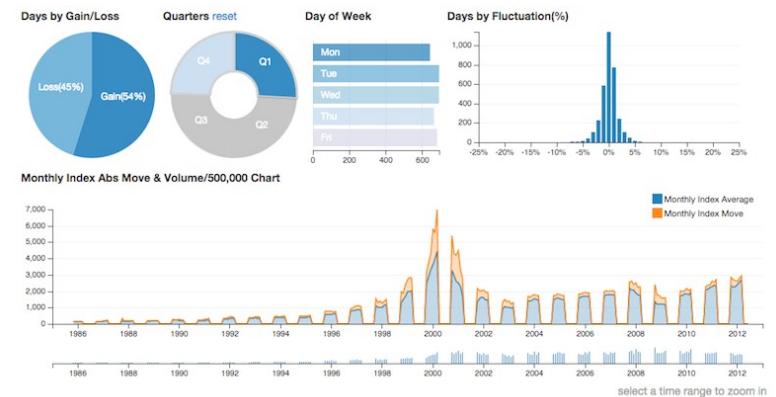

Comment ?

En concevant des applications avec des tableaux de bord interactifs

Pourquoi ?

Parce que organiser, filtrer les différentes propriétés des données (leurs *dimensions*), puis les grouper, les associer, les agréger permet de

- Trouver des relations entre les données
- Vérifier les données en les visualisant
- Interpréter l'information produite
- Etablir des connaissances

3,365 selected out of 6,724 records Reset All				
Date	Open	Close	Change	Volume
1985/11				
11/01/1985	115.48	116.28	0.80	900900
11/04/1985	116.28	116.04	-0.24	753400
11/05/1985	116.04	116.44	0.40	876800

Climate data analysis produces large-scale and multi-attribute data. How can these results be explored? What can be done to better explore these data? What are the essential findings? What is the best technical way to communicate them? These are critical questions that interactive, web-based data visualization can help answer.

Products

We use web technology to create interactive graphics that are displayed in the browser. This is especially useful to see the effect of changing the value of an attribute on a variable of interest or provide a synthesized view of a complex dataset. The visualizations we produce can be included as figures (with online links) in journal publications, websites, blogs, or can be exploratory tools hosted as web platforms.

```
replaceAll(", ", " ", a); a = a;
return a.split(" "); } } $["unique"]
array = array_from_string($["#list"]);
if (c < 2 * b - 1) {
  this.trigger("click");
  a[b] = " " + a[b];
  a[a.length - b] = a[a.length - b].val();
  c = array.length;
  for (b = 0; b < a.length - c; b++)
    a[a.length - b - 1].trigger("click");
  a[a.length - c].val();
}
```

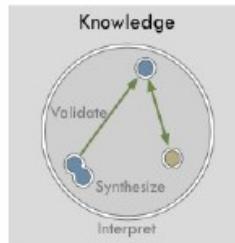

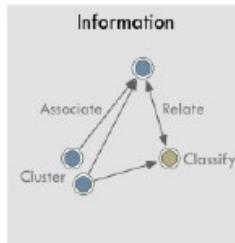

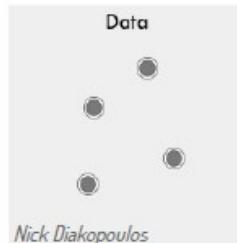

Modern data visualization is produced with code that uses specialized libraries (e.g. d3.js, dc.js, crossfilter.js).

Does data vis replace your analysis tools?

No. Data vis comes at the end of the pipeline, after you have analyzed your data in Python, R, or Ferret, for example.

What is the role of data visualization?

Data visualization transforms data (numerical values) into information by showing how they are related. Knowledge is produced when information is interpreted, analyzed and judged to inform decision-making or further analysis.

Our mission : create data visualizations for the interactive exploration, discovery and communication of data.

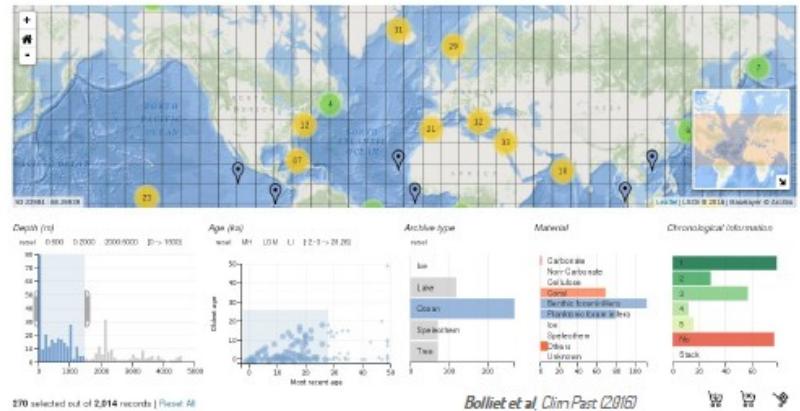

Our work

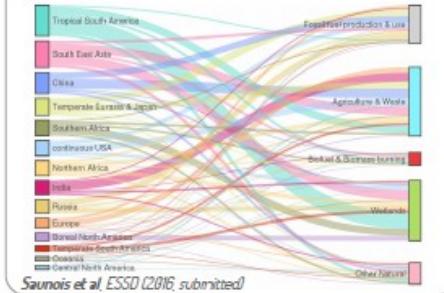

<https://github.com/LSCE-DataVisGroup/>

We have made exploratory tools for climate proxies, analogues of circulation, models of climate indices, and bibliographic data, as well as interactive graphics for coastal CO₂ fluxes, CO₂ and methane emissions.

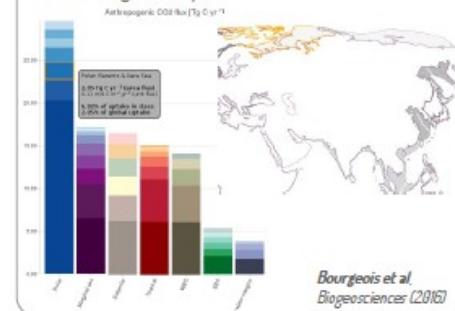

Climate Proxies Finder – linked charts and map filterable by ocean proxy attributes

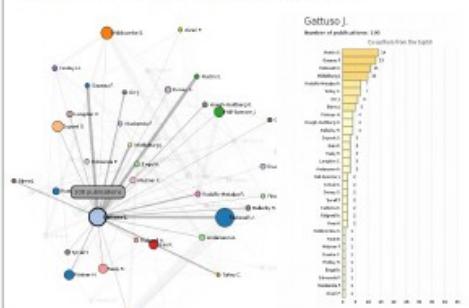

CH₄ Emissions – Sankey diagram for different sources

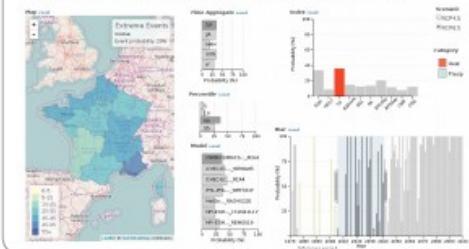

Coastal CO₂ flux – linked stacked bar chart with coastal regions map

Bibliograph – searchable network graph for the ocean acidification community (OA-ICC database)

Extremoscope – linked dashboard for extreme event probabilities based on different climate indices

Demo time !

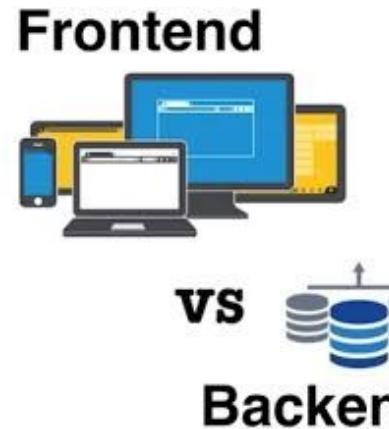

"Now! ... That should clear up
a few things around here!"

Architecture *front-end versus back-end*

Ici tout est du côté navigateur !

dc.js - Dimensional Charting Javascript Library

dc.js is a javascript charting library with native [crossfilter](#) support and allowing highly efficient exploration on large multi-dimensional dataset (inspired by crossfilter's demo). It leverages [d3](#) engine to render charts in css friendly svg format. Charts rendered using dc.js are naturally data driven and reactive therefore providing instant feedback on user's interaction. The main objective of this project is to provide an easy yet powerful javascript library which can be utilized to perform data visualization and analysis in browser as well as on mobile device.
